Facts and Myth of Aging

Goal: To dispel myths about the aging process

Objective(s):
- To provide youth, adults, senior adults and their caregivers with correct information about the aging process.
- To help correct some of the myths related to the aging process.
- Encourage empathy for those who are older.

Participants will:
- Be able to distinguish between the myths and realities of aging

Life Skill(s):
- Communication
- Citizenship
- Critical Thinking

Character Focus: Caring, Responsibility

Justification:
There are probably more myths about older people and aging than there are about any other stage of people’s lives. These myths are perpetuated by television programs, magazines, newspapers, and all parts of our society.

GLE: N/A

Delivery Mode: Group Meeting

Time Allotted: 15 to 30 minutes

Materials Needed for the Lesson:
- PowerPoint slides or slides made into posters
- Whiteboard or flip chart
- Markers appropriate for whiteboard or flip chart
- Tape for flip chart suitable for mounting on wall (unless using pre-glued type such as Post-its brand.

Number & Grade/Age of Participants: 10 to 40 participants, Ages 18 and up
Do:
Start presentation with Slide 1

Say:
All of us have heard comments about the aging process, and we see jokes about older people, and we tell jokes about them ourselves. But what do you really know about aging?

Today we are going to talk about myths about aging and see which of this we can dispel and what the real truths are about getting older.

Do:
Set up flip chart and ask audience what platitudes or clichés they have heard about aging.

Say:
I’m sure each of us has an image of an older adult in our heads when I talk about aging. Is that the same image you see of yourself as you get older? Finish this sentence: One of the first things that happens to you when you get older is… I will write a few of these (or get someone else to do so) and we will talk about them as we go through this presentation.

Do:
After writing about 6 or 7 sentence endings, stop and go back to the slides to begin a discussion of myths and truths about aging.

Say:
These are a lot of things we hear about aging. Let’s find out what the experts and other noteworthy people say about them.

Do:
Got to slide 2 and read what Henry Ford says about aging.
Say:
What do you think about Henry Ford’s statement?

Do:
Wait for audience response.
Go to slide 3 and read it aloud.

Do:
Go to slide 4 and read it aloud.

Say:
Let’s go through several notions about aging and see if we can determine whether they are myths or truths. I’ll read out the statement and you tell me whether you think it is a myth or fact.

Do:
Go to slide 5. Note: With each slide, there is an animation which requires an extra click of the mouse to bring up the “❌” image for myths and the “✅” image for truths. Allow your audience to state their answer then click on the slide to reveal the appropriate icon.

Say: Myth or Fact?

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Myth:
Alzheimer’s disease impairs a person’s memory, thinking, learning and judgment. Only about 4 million people in the U.S. have Alzheimer’s disease. About 25 to 35 % of people over 85 have Alzheimer’s disease. Most people grow older without developing Alzheimer’s. The older you get the greater the chance you have of getting Alzheimer’s. Age-related memory loss does not turn into Alzheimer’s disease. People with age-related memory loss may lose their eyeglasses. People with Alzheimer’s may not know what glasses are for. There is no cure for Alzheimer’s disease as of today. Studies show that children, siblings, and parents of people with Alzheimer’s have only a slightly higher chance of getting the disease. Alzheimer’s disease is progressive – it gets worse over time. Symptoms vary from person to person. In the early stages, symptoms may come and go. Early symptoms of Alzheimer’s disease may include forgetfulness and confusion. Another early symptom is forgetting things that have just happened. Personality changes, such as anger, anxiety, and depression are also common.

Say: Myth:
Although there are some circumstances where the statement may hold true, current research evidence suggests that intellectual performance in healthy individuals holds up well into old age. The average magnitude of intellectual decline is typically small in the 60s and 70s and is probably of little significance for competent behavior. There is more average decline for most abilities observed once the 80s are reached, although even in this age range there are substantial individual differences. Little or no decline appears to be associated with being free of cardiovascular disease, little decline in perceptual speed, at least average socioeconomic status, a stimulating and engaged lifestyle, and having flexible attitudes and behaviors at mid-life. The good news is that research data now indicate that intellectual decline can be modified by simple interventions.

Say: Myth or fact?
Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Myth:
Although learning performance tends on average to decline with age, all age groups can learn. Research studies have shown that learning performances can be improved with instruction and practice; extra time to learn information or skills; and relevance of the learning task to interests and expertise of the individual. It is well established that those who regularly practice their learning skills maintain their learning efficiency over their lifespan.

Do: Go to slide 8. Read the slide aloud.

Say:
David Kolb is responsible for the experiential learning model indicating that most of us learn by doing.

Say: Myth or fact?

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Myth:
Personality remains consistent in men and women throughout life. Personality impacts roles and life satisfaction. Particular traits in youth and middle age will not only persist but may be more pronounced in later life.

Do: Go to slide 10.

Say: Myth or fact?
Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

**Say: Fact:**
As one ages there is modest memory loss, primarily short-term memory (recent events). Older adults are more likely to retain past or new information that is based on knowledge acquired or builds upon their life course or events. Retrieval of information may slow with age. The causes of these changes are unknown, but may include stress, loss, physical disease, medication effects and depression. Lack of attention, fatigue, hearing loss, and misunderstanding are among factors impacting memory loss in persons of all ages. Strategies such as activity and exercise, association, visualization, environmental cueing, organization by category and connection to a place may help to prompt memory. New research has revealed that 40% of persons diagnosed with mild cognitive impairment (beyond what is expected for a person of that age and education) are likely to develop Alzheimer’s disease within 3 years.

**Say: Myth or fact?**

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

**Say: Fact:**
Reaction time is the interval that elapses between the onset of a stimulus and the completion of a motor response, such as hitting the brake pedal of a car when the traffic light turns yellow or red. When processing ordinary stimuli, adults do show large increases in response time with increasing age.

Do: Go to slide 12

**Say: Myth or fact?**

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

**Say: Myth:**
Depression does NOT occur more often in older adults than younger groups. However, it is the most frequent mental health problem of older adults. Depression may vary from feeling "blue" from grief over a loss to a diagnosis of clinical depression. Accurate diagnosis and treatment options are often hindered by the resistance to mental health intervention and situational depression in older adults as they react to isolation, role change, illnesses and medication effects.

Do: Go to slide 13

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.
Say: Fact:
Blood transfusions and unprotected sex put older adults at risk for HIV/AIDS as in other populations. It is estimated that as many as 10 percent of all persons diagnosed with HIV/AIDS are over 50 years of age.

Do: Go to slide 14

Say: Myth or fact?

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Myth:
There is no substantial support for this idea. A growing body of evidence suggests that, although the majority of older adults are not abstinent, the frequency and quantity of alcohol consumed tends to decrease with age. This is at least partially explained by changing patterns of sociability with age, age related health problems, and complications associated with alcohol interacting with prescribed medications. Problems with drinking later in life appear usually to be a continuation of drinking patterns established in the earlier adult years and not with late onset drinking. Therapeutic intervention is at least as effective with older adults as with adults generally.

Do: Go to slide 15

Say: Myth or fact?

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Fact:
Older adults are more prone to sleep complaints: insomnia due to changing sleep patterns of frequent awakenings, earlier rising, emotional problems. The quality of sleep declines with age. It becomes particularly more difficult to stay asleep. Daily sedation, boredom, loneliness, illness, time changes, work schedules, physical changes and alcohol or medication may affect sleep patterns. Sleep behaviors common to older adults may include increased napping, periods of sleep apnea (stopped breathing), more frequent awakenings, lengthened onset of sleep, increased time in bed and increased total sleep time. Current research verifies that sleep in which dreaming takes place or deep sleep, in older adults may be half what it is in younger persons.

Before we go any further, let’s talk about myths and facts in general. How might these myths commonly believed by people, limit the lives of older people?

Do: Encourage discussion by volunteers. Note some of the discussion on the flip chart.

Do: Go to slide 16
Say: Myth or fact?

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Myth:
The national suicide rate is about 12 per 100,000 population, while it is 1.3 for those aged 65 to 74 and 23 per 100,000 for those over age 85. It has been estimated that 17 to 25 percent of all reported suicides occur in persons aged 65 and older. (Hooyman,178). However, older white males largely account for this high rate. For white women and for men and women of all other races, the suicide rate peaks earlier in the life span. Older adults also have a higher ratio of completed to attempted suicides than younger groups. The higher suicide rates might be explained by a variety of factors, including the loss of roles and status, chronic illnesses that diminish one's sense of control, and social isolation.

Do: Go to slide 17

Say: Myth or fact?

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Fact:
There is evidence that high blood pressure does increase with age. However, there is controversy over the criteria for high blood pressure. Studies and physicians differ in their definition of high blood pressure. Most consider a person's age plus 100 as a reasonable systolic reading with a diastolic reading of 90. The systolic (higher number) measure is the pressure when the heart is stressed as it contracts and is recorded when the pressure cuff is first released after being tightened. The diastolic (lower number) is the blood pressure when the heart is at rest and is derived when the blood pressure returns to normal after the first rush of blood upon release of the cuff. The Fifth Report of the Joint National Commission on Detection, Evaluation and Treatment of High Blood Pressure states young and old have the same blood pressure, so 140/90 is a standard benchmark. It is thought that more than 50% of persons over 65 years in industrialized society have greater than 140/90.

Do: Go to slide 18

Say: Myth or fact?

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Fact:
Perspiration and quenching of thirst help to combat overheating. Older adults perspire less, are less aware of thirst and less able to feel or adapt to extremes in temperature than younger persons. Less sensitive skin sensors and less insulation of fatty deposits under the skin and the less efficient functioning of the hypothalamus (the temperature
regulating mechanism in the brain) occur in older adults. Prolonged time for older adults to return to core temperature after exposure to extreme heat or cold begins at age 70 years and increases thereafter. Education and taking precautions may prevent most deaths related to temperature extremes. Increased fluid intake, gradual accommodation to climate change, rest, minimizing exertion during heat, use of fans and/or air conditioning, wearing hats and loose clothing and avoidance of alcohol are some strategies for hyperthermia.

**Do:** Go to slide 19

**Say:** Myth or fact?

**Do:** Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

**Say:** Myth:
There is a gradual loss of bony tissue, which causes brittle bones that fracture more easily in both men and women as they age. Osteoporosis develops more often in women when calcium is lost (following hormonal change after menopause) or insufficiently taken and absorbed. Deficiency in bone mineral density occurs in 50% of women over 50 years to 57% of women 70 years or older, but decreases to 45% for those over 80 years. Women rarely develop osteoporosis until age 70 years. A test of bone density can measure bone mass by x-ray or computer analyzed e-ray. Prevention of osteoporosis begins with adequate Calcium intake in one's teens and thereafter with increased attention after menopause. Weight bearing exercise; hormone replacement therapy (HRT); decreased alcohol, protein, salt and caffeine consumption; smoking cessation and adequate Vitamin D intake may minimize bone loss. HRT may offer some protection against heart disease, cognitive impairment and bone loss, but also may present risks for cervical cancer. Risk factors of osteoporosis include excess alcohol, little physical activity, deficient calcium intake, no pregnancies, no breast feeding, fair complexion, blond or red hair and of European nationality.

**Say:** Myth or fact?

**Do:** Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

**Say:** Fact:
Due to osteoporosis, osteoarthritis and a lifetime of wear and tear, upper vertebrae are weakened; joint spaces and buffering tissues wear and muscles are lost. These changes foster decreased padding between vertebral discs, which accounts for a loss of height. The height changes and imbalances contribute to pain and stress on the lower back with advanced age.

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Fact:
As one ages muscle mass declines, cartilage erodes, membranes harden, and fluid thickens. These contribute to stiffness, gait problems, lessened mobility, and limited range of motion. From age 30 years, muscle mass declines to almost 50% in old age. Research shows that weight bearing exercises, aerobics and weight resistance can restore muscle strength, increase stamina, stabilize balance and minimize falls.

Say: Myth
Recent studies validate that more than 70% of men and women continue sexual activity after 65 years. Men and women over 70 are still considered potentially “sexy,” Reasons for limited sexual activity include loss of partners, illness and medications. Most older adults consider intimacy crucial to relationships and emotional well being. Intimacy may be satisfied by other means than sexual relations, such as touch, hugging and holding.

Do: Go to slide 24

Say: Myth or fact?

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Fact:
While there is considerable individual variation, on average sensory processes (vision, hearing, taste, smell, and touch) don’t work as well as people get older. Another way to say it is that the threshold at which we take in stimuli increases with age. The eye lens, for example, is less able to change shape so as to adjust to close and far objects, and the size of the pupil narrows so as to let in less light. Hearing loss begins at age 20, and for many involves growing inability to hear higher frequencies as sensory receptors in the ear and nerve cells in the auditory pathway to the brain are lost. Taste buds become less sensitive with aging, and after age 80 more than 75 percent of older adults show major impairment in their sense of smell. Many of these normal changes can be compensated for through increasingly sophisticated assistive devices (hearing aides, glasses, etc.) and through modifications of the older person's environment.

Do: Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

Say: Fact:
Although death in industrialized society has come to be associated primarily with old age, studies generally indicate that death anxiety in adults decreases as age increases. Among the factors that may contribute to lower anxiety are a sense that goals have been fulfilled, living longer than expected, coming to terms with finitude and dealing with the deaths of friends. The general finding that older adults are less fearful of death than their middle-aged counterparts should not obscure the fact that some older adults may have considerable preoccupation and concern about death and dying. Some fear the process of dying much more than death itself.

Do: Go to slide 30

Say: Fact:
The human life cycle includes birth, childhood, adult life, old age and death. Planning and preparation are essential for each of these stages. Lack of planning can have disastrous consequences for any stage of life. Death is not a question of if, but of when, and each of us has some choice in making end-of-life decisions and the final arrangements and selecting related services. Planning for one’s inevitable death provides the family with peace of mind, assuring them they have acted in accordance relating to the wishes of the deceased. Shock, disorganization, volatile emotions, guilt and the sense of loss and loneliness can cloud making important decisions. Planning one’s own final arrangements assures the fulfillment of personal wishes and spares family members from facing decisions that can be both emotionally and financially difficult. It provides the family with peace of mind, assuring them they have acted in accordance with your wishes.

Say: Myth:
Evidence from several studies and national surveys indicates that families are the major care providers for impaired older adults. Families provide 70 to 80 percent of the in-home care for older relatives with chronic impairments. Family members have cared for the typical older adult who reaches a long-term care setting for a significant amount of time first. Research has shown that adult children are the primary caregivers for older widowed women and older unmarried men, and they are the secondary caregivers in situations where the spouse of an older person is still alive. Parent care has become a predictable and nearly universal experience across the life course, although most people are not adequately prepared for it.

**Do:** Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

**Say:** Myth:
While the proportion of older people (65+) living below the poverty level has declined significantly since 1960 to about 10.5 percent, this index rather dramatically underestimates need. The poverty level is based on an estimate of the cost of items in the Department of Agriculture’s least costly nutritionally adequate food plan and multiplied by three (suggesting that food costs represent one third of a budget). This is probably not a fair representation of living costs in many areas of the country, particularly urban areas. Therefore, gerontologists and economists also look at the proportion near poverty level (up to 150 percent of poverty level) and find that nearly one quarter of older adults fall below this line. These older people tend to be disproportionately women, unmarried (including widowed, African American or Hispanic, and living alone.

**Do:** Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

**Say:** Myth:
Some older adults do have visual, motor, or cognitive impairments that make them dangerous drivers. Many drive more slowly and cautiously or avoid driving in conditions they consider threatening in order to compensate for these changes. Until approximately age 85 older adults have fewer driver fatalities per million drivers than men 20 years old, but they do have more accidents per miles driven. Unsafe speed and alcohol use are leading factors in accidents for young drivers, while right-of-way violations are the leading cause of accidents involving older drivers--which implies a breakdown in such cognitive-perceptual components as estimating the speed of oncoming cars or reacting too slowly to unexpected events. Older drivers’ skills can be improved considerably by specific driver training such as through the AARP "55 ALIVE/Mature Driving" program.

Say: Myth:
Although the media may leave the impression that older adults are a major target of violent crime, annual data from the national Crime Victimization Surveys consistently indicate that violent crime, personal theft, and household victimization rates for persons aged 65 and older are the lowest of any age group. Data indicate that this holds true for virtually all categories of criminal victimization: rape, robbery, aggravated assault, simple assault, and personal larceny without contact. Only for the category of personal larceny with contact (e.g., purse snatching and pocket picking) is the victimization rate higher for persons aged 65 and over compared to those aged 25 to 64. This type of
victimization may lead to identity theft and fraud against the elderly. Nevertheless, the health and financial consequences may be greater for the older victim.

Say: Fact:
Older adults do experience multiple losses of loved ones and friends, illness, relocation, retirement, income, change and decline in abilities. It may take an older adult longer to adjust to a major change or recover from prolonged and intense physical and emotional stress. The recovery of an older body from a traumatic event may be delayed due to age related decreases in cardiac output and heart rate ad more vulnerability to disease with a less effective immune system. However, the many older adults who have
developed active and healthy lifestyles may be able to resist/mitigate some of the negative effects of stress or illness due to their physiological fitness. Likewise, coping skills that have been developed or strengthened during a lifetime may lessen the damage of psychological stresses and ease adjustments to loss and change.

**Say:** Myth or fact?

**Do:** Wait for audience response, click again on slide to reveal “myth” or “fact” icons.

**Say:** Fact:
The majority of older adults perceive their health to be good to excellent, as they do not compare their current condition to former states, but rather to their peers of their same age and older who may be "worse off." The "ratings" are not a medical assessment. While chronic disease, frailty and disability are correlated with advanced age, the Myths and Realities 2000 study discovered that 84% of all Americans would like to live to 90 years and half of persons over 65 years described their lives as "the best years of my life." Disease and disability are being delayed and functional levels are improving, especially in persons over 80 years. Less than 10% of non-institutionalized persons 70 years and over are unable to perform one or more activities of daily living (ADLs). Disability does increase to 22% for those 85 years and older.

**Say:** Fact:
In general women throughout adulthood are more likely to attend to minor symptoms than are men. Men are more likely to have been socialized even as children to be stoical, and consequently are less likely to see a doctor for non-serious health problems. When they do get sick, they are likely to have more and longer hospital visits. Women, on the other hand, are more likely to have had regular contact with the health care system through childbirth, attending to their children's health, and having regular screening procedures for cervical and breast cancer. Although women report more chronic conditions than men in later life, the severity of their problems tends to be less than that of same age men, probably due to their earlier health care practices -- hence the phrase "women get sicker, but men die quicker."

**Say:** Myth or fact?

**Do:** Wait for audience response, click again on slide to reveal “myth” or “fact” icons.
Say: Myth:
Old age is a social construct. Meanings, definitions, and experiences of aging vary across cultures and throughout history. What people consider to be "old" has changed significantly just within the past 100 years in the U.S. as people live longer and healthier. Being identified as "old" is related not only to chronological age, but also health, functional ability, social roles, and self perception. Age 65 is an arbitrary marker that has been associated with eligibility for governmental programs such as Social Security and Medicare (although the age of eligibility for Social Security is gradually being raised to 67 by 2027.)

Do: Go to slide 50

Say: Okay, let’s see how many of the facts you do remember about aging.

Do: Put away flip charts to avoid disclosing answers to test. Distribute post-test. May also use post-test and pre-test. Be sure to distinguish which is which! If you plan to do individual comparisons of pre- and post tests, be sure to give each participant a unique code they use on both pre- and post-tests. Collect pre- and post-tests, and report number of correct responses on impact reports and to LSU AgCenter Family and Child Development specialists.

What do you know about Myths and Facts of Aging?

Circle T for true and F for false.

T  F  1.  Personality changes with age.
T  F  2.  It is very difficult for older adults to learn new things.
T  F  3.  Memory loss is a normal part of aging
T  F  4.  Older adults have more trouble sleeping than younger adults.
T  F  5.  The majority of people over the age of 65 have Alzheimer’s disease.
T  F  6.  As people live longer, they face fewer acute health conditions.
T  F  7.  The modern family no longer takes care of its elderly.
T  F  8.  Retirement is often detrimental to health—i.e., people seem to become ill or die soon after retirement.
T  F  9.  As people grow older, their intelligence declines significantly.
T  F  10.  Older adults are at high risk for HIV/AIDS.
T  F  11.  Depression occurs more frequently in older adults than in young adults.
T  F  12.  Alcoholism and alcohol abuse are greater problems in those over the age of 65.
T  F  13.  Older adults have the highest suicide rate of any age group.
T  F  14.  Older people perspire less, so they are more likely to suffer from hyperthermia.
T  F  15.  Osteoporosis is a normal part of the aging process for women.
T  F  16.  All five senses tend to decline with advancing age.
T  F  17.  Retirement is often detrimental to health—i.e., people seem to become ill or die soon after retirement.
T  F  18.  Older adults are less anxious about death than are younger adults.
T  F  19.  People 65 years of age and older currently make up about 20% of the U.S. population.
T  F  20.  Older workers cannot work as effectively as younger workers.
